before the checks
check_model(model, inputs, targets, ...)
resolve how to run the model: arguments, then plugin, then defaults
copy the inputs (lazy modules: an initialised copy)
snapshot: state_dict, non-persistent buffers, optimizer state, .grad, train/eval flags
fork the PyTorch, Python and NumPy RNGs
for each of the 18 checks
restore the snapshot, reseed
run the check: PASS / WARN / FAIL / SKIP
after the checks
restore the snapshot and the RNGs
